

## Packaging Performance Testing

The primary role of packaging is to keep a sterile medical device sterile. ISO 11607 (*Packaging for terminally sterilized medical devices*) states this and describes a variety of areas where packaging performance should be assessed. These areas include: barrier material performance, sealing machine validation, shelf life assessment and transit simulation. MET's testing laboratory provides complete, independent analysis of all your validation requirements. New additions in chemical testing equipment also deliver 'leachables' and 'extractables' testing along with stability studies.
